

**Congratulations on the purchase of your new
GOLDFISH
from Passion for Pets.**

You can expect to enjoy many happy and rewarding years together with your new goldfish and to assist you in giving your goldfish the care it deserves we have provided the following information.

WHAT YOU NEED TO SET UP YOUR GOLDFISH.

A Fish Bowl or Fish Tank
Chlorine Neutraliser
Water Conditioner such as Conditioning Salts
Live Bacteria such as Cycle
Aquarium Gravel
Ornaments or Plastic Plants
Live Plants
Plant food
Fish Food
A pH Test Kit
A Gravel Cleaner
A Filter (optional)
Aquarium Foam
Background

SETTING UP YOUR FISH TANK.

1. Choose a home for your goldfish tank/bowl that is not in direct sunlight. Rinse your tank/bowl and place it on aquarium foam in its new home.
2. Thoroughly rinse your aquarium gravel in a strainer under fast running water to remove all dust and dirt particles. Now place this in an even layer across the bottom of your tank/bowl.
3. Fill your tank/bowl with tap water ensuring that you count how many litres you are adding.
4. Add the appropriate amount of chlorine neutraliser, water conditioner, live bacteria and plant food to the filled tank/bowl. Always use the instructions

on the packet to add the correct amount. Thoroughly shake all bottles first as many contain sediment.

5. Decorate your tank with your ornaments/plastic plants and live plants.
6. If you are installing a filter place your filter in the tank/bowl ensuring you have followed the filters instructions thoroughly. Once installed turn the filter on.
7. Secure your background to the outside of your tank/bowl.
8. Your tank is now ready to go!

ARRIVING HOME

Place your goldfish (still in the sealed bag) into your tank/bowl and allow it to sit for ten minutes to adjust to the different water temperatures. While waiting perform a pH test and make any adjustments as needed.

After ten minutes untie the top of the bag and allow some of the tank/bowl water to mix with your goldfish, then gently upend the entire bag to allow your fish to swim into its new home.

FEEDING

It is best not to feed your goldfish straight away after arriving home, always wait a few hours first to allow your fish to feel completely comfortable.

It is best to feed your goldfish a varied diet to keep it happy and healthy, you should alternate its food every other day.

You can feed your goldfish flake food, pellet food, freeze dried food, frozen food and live food. You should give your fish live food at least once a week. Your Passion for Pets staff member can show you the different foods suitable to feed your goldfish.

The size of your fish's stomach is only as big as its eye so it is best to feed your goldfish small amounts of food once to twice a day. It is better to give really little amounts twice a day as uneaten food simply falls into the aquarium gravel and starts to breakdown into harmful ammonia almost immediately.

Your live plants need to be fed as well with plant food. Plant food contains nutrients that are not found in a newly established aquarium. It is recommended

to feed your plants three times a week for the first two weeks then twice a week for the second two weeks then once a week after that.

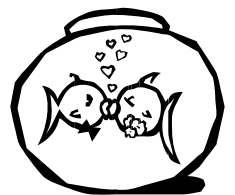

WHY ADD PRODUCTS TO THE TAP WATER?

Many people ask why we recommend to add certain products to tap water before putting it into your tank, as years ago many people kept fish without ever having to add anything to the water. The main reason for this is that years ago only chlorine was added to tap water to make it safe for us to drink. After a small period of time chlorine will evaporate making the water ok for fish. However now chloramine is added with chlorine to make our water safe to drink. Chloramine does not evaporate and doesn't completely disappear from filtered water. Chloramine is harmful to fish. It actually burns them causing quite a lot of pain and eventually death. Also for most parts of Melbourne our tap water is quite soft, as it doesn't run over many rocks and clay to absorb minerals to make it hard. Generally our tap water is at 30ppm hardness. Goldfish require a minimum 100ppm hardness to survive. This is why we must add a water conditioner to put back the minerals, calcium and salts that our tap water is missing.

The following products must be used to turn tap water into aquarium water.

Tri Start/ Chlorine Neutraliser / Water Ager are chemicals that condition the water while by removing chemicals. These chemicals do not add minerals to harden our soft water. Therefore you need to use these products in conjunction with a water conditioner.

Geo-Liquid is not a chemical it actually attaches to the chlorine, fluoride and chloramine particles and naturally breaks them down. Geo Liquid also contains the minerals, calcium and salts to raise the water hardness. You can actually see the geo liquid working as it turns the water a milky colour during this process. It becomes crystal clear once it has finished. It is recommended to use a live bacteria with geo liquid to increase the effectiveness of it. It is very important to thoroughly shake Geo-Liquid first as the minerals are like a sediment on the bottom of the bottle and these must be mixed for it to work.

Safe Guard 5 works well in conjunction with geo liquid as it increases the speed at which the chlorine and chloramine is removed. But the best thing about this product is it contains aloe vera and puts a protective coating over the fish that helps to reduce stress and prevent the fish from injury from the net, bag and ornaments.

Water Conditioning Salts, need to be used in conjunction with a chlorine neutraliser to make the water harder.

Pura Water / Cycle / Bio booster - these are all live bacterial products. They help put good bacteria into the aquarium water that would otherwise take a long period of time to naturally occur. Good bacteria have a very important role in the aquarium. It breaks down fish waste and food waste to prevent it from turning into harmful ammonia.

At Passion For Pets we use Geo Liquid, Pura Water and Safe Guard 5 in all of our tanks to keep our fish healthy.

TANK / BOWL MAINTAINENCE

Fish prefer a small amount of cleaning often rather than being left alone for a long period of time, then a lot of cleaning at once. To keep your goldfish happy and healthy we recommend that you clean your bowl/ tank on a weekly basis. The best way to do this is by using a gravel cleaner. You should not take out more than 1/3 of the total water volume at once. Our Passion for Pets staff can show you how to use a gravel cleaner.

It is best not to disrupt your goldfish by removing all ornaments and plants when cleaning the tank / bowl. Never remove the gravel and wash under tap water as you will kill all of your good live bacteria. Your gravel is cleaned by using a gravel cleaner.

Always add your water products to the tap water before putting it into your tank/bowl.

Make sure you have a bucket that is only used for your goldfish. Make sure the bucket has never had cleaners in it as the chemicals are harmful to your goldfish.

You need to perform a pH test once weekly.

FILTERS AND PUMPS

Depending on the size of your tank/bowl you may need a filter to remove waste and to oxygenate the water. Even with a filter you still need to perform your cleaning routine including changing a 1/3 of the water weekly.

Your Passion for Pets staff member can show you the different filters now available. The filter that you choose must be powerful enough to pump the entire water content of your tank three times each hour to properly clean and oxygenate the water.

If you have a bowl that has more than one goldfish or a small opening at the top you will need a pump with either an airstone or aerating ornament to help oxygenate the water. Your Passion for Pets staff member can help you decide if your bowl requires this or not.

HOUSEHOLD DANGERS

As well as not using a bucket that has had chemicals in it for your tank/bowl, it is also important to avoid using aerosol sprays near your tank/bowl. Aerosol sprays will leave a residue on the top of the water and will poison your fish as they come to the surface for air or to eat. Always cover your tank/bowl with glad wrap first or do not use the spray.
